## DETAILED ACTION

### *Allowable Subject Matter*

Claims 1-30 are allowed.

The following is an examiner's statement of reasons for allowance:

Claim 1 recites "wherein the lamellas each have at least one radial outer widened section, extending in a rotational direction of the separator, and at least one remaining lamella section, wherein the at least one radial outer widened section and the at least one remaining lamella section delimit together a turbulence chamber respectively".

Woodworth et al(4840645) teaches a high speed rotary separator including a bottom and a sidewall connected to the bottom and including lamellas delimiting slots, however Woodworth et al fails to teach wherein the lamellas each have at least one radial outer widened section, extending in a rotational direction of the separator, and at least one remaining lamella section, wherein the at least one radial outer widened section and the at least one remaining lamella section delimit together a turbulence chamber respectively. Arnold(2368961) teaches a high speed rotary separator including a bottom and a sidewall connected to the bottom and including lamellas delimiting slots, however Woodworth et al fails to teach wherein the lamellas each have at least one radial outer widened section, extending in a rotational direction of the separator, and at least one remaining lamella section, wherein the at least one radial outer widened section and the at least one remaining lamella section delimit together a turbulence chamber respectively. Arnold teaches angular blades having 90 degrees between their sides, however one section does not extend in a rotational direction of the separator. It would

not have been obvious to someone of ordinary skill in the art at the time of the invention to provide wherein the lamellas each have at least one radial outer widened section, extending in a rotational direction of the separator, and at least one remaining lamella section, wherein the at least one radial outer widened section and the at least one remaining lamella section delimit together a turbulence chamber respectively because Woodworth et al and Arnold does not suggest such a modification. Claims 2-29 depend on claim 1 and hence are also allowed.

Claims 30 recites "wherein the lamellas have at least one opening connecting the interior of the separator with an exterior side of the lamellas". Woodworth et al and Arnold teaches a high speed rotary separator including a bottom and a sidewall connected to the bottom and including lamellas delimiting slots , however Woodworth et al and Arnold fails to teach wherein the lamellas have at least one opening connecting the interior of the separator with an exterior side of the lamellas. It would not have been obvious to someone of ordinary skill in the art at the time of the invention to provide wherein the lamellas have at least one opening connecting the interior of the separator with an exterior side of the lamellas because Woodworth et al does not suggest such a modification.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
